

L A R A M E D I A

Laramedia is a social media web app. People with different roles can register to the system. Different roles according to their level of access can do and view certain actions. For example, People can add (CRUD) users, add (CRUD) multiple media file, add (CRUD) posts, add (CRUD) comment on the posts and reply to them accordingly and only approved comment by admins are shown. They can add categories which later can be used in post.

The front-end part of this project is using HTML, CSS, Bootstrap, CSS animation, Javascript and jQuery.

Its back-end part benefits from a powerful framework, LARAVEL. It uses its templating engine (Blade), Eloquent ORM database model, its services, Webpacks and its powerful artisan command line interface. In its latest version it uses Disqus web API for its commenting system which allows comments to be edited, shared and stored independently in the cloud,. It uses open source library DropZoneJS that provides adding multiple media. It uses TinyMCE API for enhancing posts functionality and since it has deployed to Heroku its former Database Which was MySQL has changed to ClearDB. you can see pictures of the project in the following pages.

Laravel is a free, open-source PHP web framework, created by Taylor Otwell and intended for the development of web applications following the model-view-controller (MVC) architectural pattern. Some of the features of Laravel are a modular packaging system with a dedicated dependency manager, different ways for accessing relational databases, utilities that aid in application deployment and maintenance, and its orientation toward syntactic sugar.

As of March 2015, Laravel is regarded as one of the most popular PHP frameworks, together with Symfony, CodeIgniter, Yii2 and others.

The source code of Laravel is hosted on GitHub and licensed under the terms of MIT License.
